Title: To understand and apply the concept of data constraints in SQL, focusing on Primary Key and Foreign Key constraints.

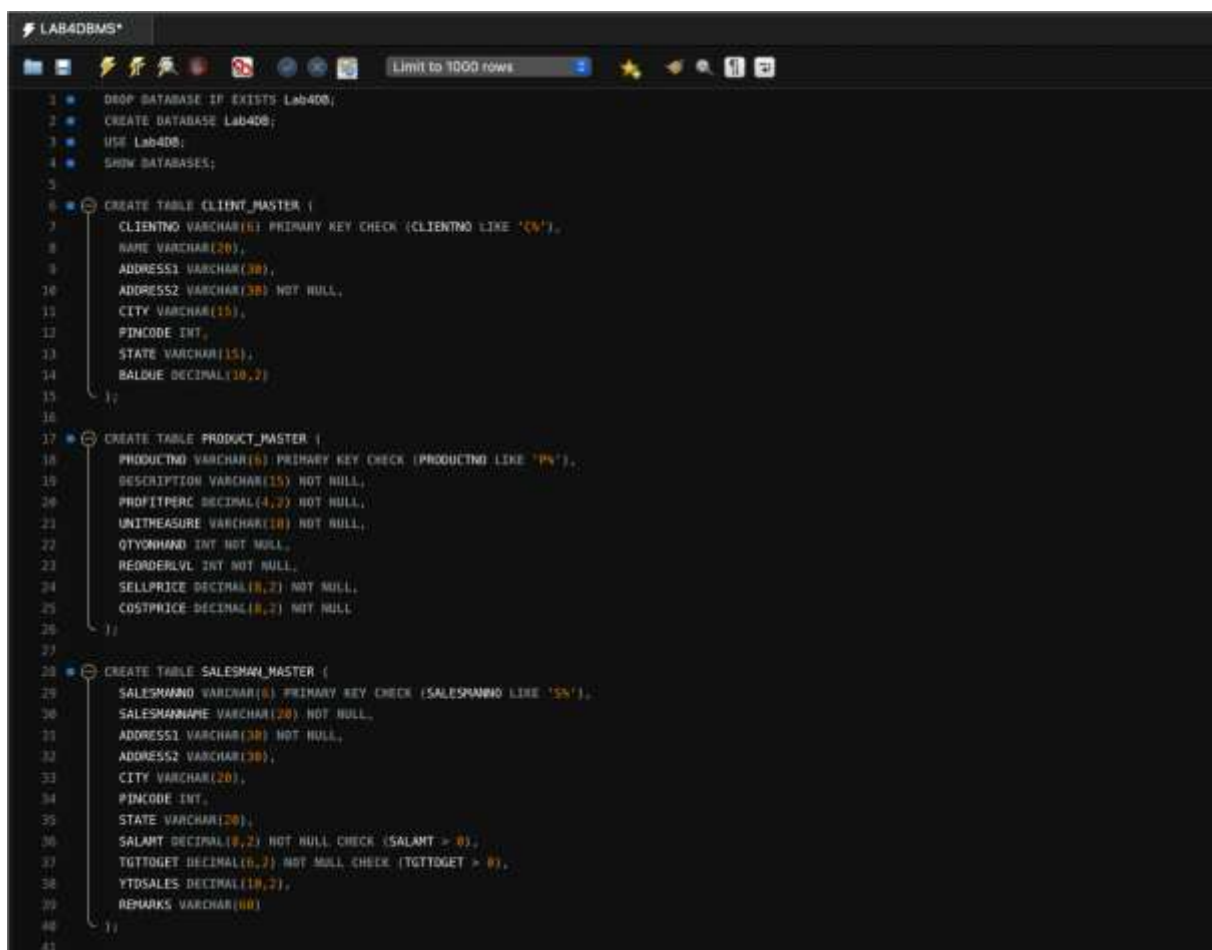

Objective: Apply various data constraints in SQL—Primary Key, Foreign Key, **NOT NULL**, and **CHECK**.

Tasks outline from the manual: 1. Create

three master tables with constraints:

- **CLIENT_MASTER**
 - **PRODUCT_MASTER**
 - **SALESMAN_MASTER**
2. Insert sample data into each table.
 3. Run retrieval queries (will help show data and confirm constraints work).

CREATE TABLE : CLIENT_MASTER / PRODUCT_MASTER / SALESMAN_MASTER

1. Created tables using **CREATE TABLE**;
2. Insert data in the query using **INSERT INTO**;

While creating tables I encountered various errors which are listed at the end of the document.

ERRORS ENCOUNTERED / RESOLVED:

1. **CREATE TABLE CLIENT_MASTER (CLIENTNO VARCHAR(6) PRIMARY KEY CHECK (CLIENTNO LIKE 'C%'), NAME VARCHAR(20), ADDRESS1 VARCHAR(30), ADDRESS2 VARCHAR(30) NOT NULL, CITY VARCHAR(15), PINCODE INT(8), STATE VARCHAR(15), BALDUE DECIMAL(10,2))** 0 row(s) affected, 1 warning(s): 1681 Integer display width is deprecated and will be removed in a future release.

In newer versions of mysql specifying INT Width is not necessary. After removing width from the INT constraints the error was resolved.

Column 'ADDRESS1' cannot be null

In the given data address 1 for Raj was not specified and it fell under NOT NULL condition. To resolve this error we have two ways, a) remove NOT NULL condition, b) add a temporary address.

We cannot use method a) because Address 1 cannot be null. Therefore the error was resolved using method b). **temporary address : qwerty**

Key Observation: SAFE MODE in MySQL

- MySQL Workbench enables Safe Update Mode by default.
- In this mode, **UPDATE** and **DELETE** queries must include a **WHERE** clause using a key column (like Primary Key), or they will be blocked.
- This feature prevents accidental modification or deletion of all rows in a table.

UPDATE SALESMAN_MASTER SET CITY = 'Pune'; was blocked because it had no **WHERE** condition.

The query works if written as:

UPDATE SALESMAN_MASTER SET CITY = 'Pune' WHERE SALESMANNO = 'S00001';

Alternatively, Safe Mode can be disabled temporarily by running:

SET SQL_SAFE_UPDATES = 0; or permanently via Workbench Preferences.
